

SKY-NET WHITE PAPER

Ver. 1.0

NOV 2018

Provides by SKYHASH

Disclaimer – Legal Notice

IMPORTANT NOTICE

This White Paper has been issued by SKY-HASH Limited (the “Company”) on 30/11/2018 and should be read in conjunction with the Company’s terms and conditions (the “Terms”). The term coin and token are used interchangeably. The purpose of this White Paper is to provide prospective purchasers with the information on the Company’s project to allow the prospective purchasers to make their own decision as to whether or not it wishes to proceed to purchase a SKYCoin. This White Paper does not constitute an offer or invitation, or any other sale or purchase of shares, securities, or any of the assets of the Company. The Board of Directors of the Company have taken reasonable care to ensure that, as at the date of this White Paper, the information contained herein is accurate to the best of their knowledge and there are no other facts, the omission of which, would make misleading any statement in this White Paper. No representation, warranty, assurance or undertaking is made as to its continued accuracy after such date. The information contained in this White Paper may be subject to modification, supplementation and amendment at any time and from time to time. This White Paper describes the Company’s business objectives and the issue by the Company of SKYCoin. It has not been reviewed, verified, approved or authorized by any regulatory or supervisory authority. The following content provided is for informational purposes related to our approach of providing a solution based on blockchain technology. The following information may not be comprehensive and does not imply any elements of a contractual relationship. This document does not constitute the provision of investment or professional advisory services. The Company does not guarantee, and accept legal liability whatsoever arising from or connected to, the accuracy, reliability, or completeness of any material contained in this document. It is the responsibility of prospective purchasers of SKYCoin to undertake their own due diligence. The publication of this White Paper and the offering of SKYCoin may be restricted in certain jurisdictions. It is the responsibility of any person in possession of this White Paper and any persons wishing to make an application for SKYCoin (pursuant to the Terms) to

inform themselves of, and to observe, any and all laws and regulations that may be applicable to them. This White Paper does not constitute an offer or solicitation to anyone in any jurisdiction in which such offer or solicitation is not lawful or in which the person making such offer or solicitation is not qualified to do so. The platform and /or the SKYCoin are not intended to constitute securities in any jurisdiction. This whitepaper does not constitute a prospectus or offer document in any form and is not intended to constitute an offer of securities or a solicitation for investment in securities in any jurisdiction. The Company token holders will not receive any form of a dividend or any other revenue right. Nor will the SKYCoin participate in a profit-sharing scheme or the profits of the Company. Prospective purchasers of SKYCoin should inform themselves as to the legal requirements and consequences of purchasing, holding and disposing of SKYCoin and any applicable exchange control regulations and taxes in the countries of their respective citizenship, residence and/or domicile. Prospective purchasers of SKYCoin are wholly responsible for ensuring that all aspects of this White Paper and the Terms are acceptable to them. The purchase of SKYCoin tokens may involve special risks that could lead to a loss of all or a substantial portion of the purchase amount. The purchase of SKYCoin is considered speculative in nature and it involves a high degree of risk. The Company does not represent, warrant, undertake or assure that the SKYCoin are defect/virus free or will meet any specific requirements of a prospective purchaser. You should only purchase SKYCoin if you can afford a complete loss. Unless you fully understand and accept the nature of the SKYCoin and the potential risks inherent in the purchase of SKYCoin you should not purchase SKYCoin. The purchase of SKYCoin is only possible after the prospective purchaser has read, understood and accepted the Terms. Each prospective purchaser will be required to acknowledge that it made an independent decision to purchase the SKYCoin tokens and that it is not relying, in any manner whatsoever, on the Company, its Board of Directors or any other person or entity (other than such purchaser's own advisers). Prospective purchasers are urged to consult their own legal, tax or other advisor before purchasing SKYCoin tokens. The Company and its Board of Directors do not provide any advice or recommendations with respect to the SKYCoin, nor do they endorse such tokens, nor do they accept any responsibility or liability for any use of this White Paper by any person which is in breach of any local regulatory requirements with regard to the distribution of this White Paper or any applicable rules pertaining to the offer of SKYCoin. Statements made in this White Paper are based on the law and practice currently in force in Estonia and are subject to changes in those laws. The SKYCoin will not be available to individuals or entities that are ordinarily resident in the United States of America or the People's Republic of China.

persons from the United States of America or the People's Republic of China that participate in the token sale by providing false or inaccurate information about their citizenship, residency and/or nationality shall be in breach of these terms and shall be required to forfeit the SKYCoin and indemnify company in respect of any damages and/or losses suffered due to this breach in accordance with the indemnification provisions set out in these terms. To the maximum extent permitted by the applicable laws, regulations and rules, the Company, its founders, team members and any third party involved in the Company's project shall not be liable for any indirect, special, incidental, consequential or other losses of any kind. Furthermore, in tort, contract or otherwise (including but not limited to loss of revenue, income or profits, and loss of use or data), arising out of or in connection with any acceptance of, or reliance on this White Paper. All statements regarding the Company's financial position, business strategies, plans and prospects and the prospects of the industry which the Company is in are forward-looking statements. Neither the Company, its founders, team members, any third party involved in the Company's project nor any other person represents, warrants and undertakes that the actual future results, performance or achievements of the Company will be as discussed in these forward-looking statements. This White Paper includes market and industry information and forecasts, which the Company has obtained from internal surveys, reports and studies, where appropriate, as well as market research, publicly available information and industry publications. Such surveys, reports, studies, market research, publicly available information and publications state that the information that they contain has come from sources believed to be reliable, but there can be no assurance as to the accuracy or completeness of such included information. The Company does not make, or purport to make and disclaims any representation, warranty or undertaking in any form whatsoever to any entity or person. Including any representation, warranty or undertaking about the truth, accuracy, and completeness of any of the information set out in this White Paper.

The Company

- Company Name: SKYHASH OÜ
- Address: NARVA MNT 5, 10117 HARAJUMAA, TALLIN, EESTI VABARIIK
- Corporate Registration Number: EE85-2200-2210-6872-4864
- E-mail: info@sky-hash.net
- Description of Business:
- Blockchain Development Application Development Mining Business
 - Cloud Mining Service <http://sky-hash.net>
 - Hosting Service (under development)
 - Consulting Service (for the individuals and corporations)
 - Mining Farm Operation Service Design, development, and selling of Mining related equipment.

1. Executive Summary

Internet gives the revolution in present economic society but it is still untrusted and centralized proprietary services network. Now it is required decentralized service model. Such as Fintech application needs trust transaction on Internet. These parties will be replaced with variable computation. Brittle location addresses will be replaced with resilient content addresses. Monolithic services will be replaced with peer-to-peer algorithmic markets. The Bitcoin, Ethereum, and other alternative are utilizing Blockchain networks have a proven utility of decentralized transaction. These public transactions process sophisticated and smart contract applications and transact crypto-assets worth tens of billions of dollars. Recently, substantial number of people worldwide are involved in mining coins every day and have proven that people are willing to contribute to the applications, providing it gives them a return on the work done. Thus, blockchain is the technology of trust transaction on Internet. Blockchain is also often used to reward people with cryptocurrency. According to mining market report on 2018, there are more than 50 Billions USD annual mining value. Crypto currency market now become new economic domain global based. The mining is still good motivation for people who are interested in crypto currency market field. The challenge of mining people, how they increase their reward and which coins are better to mining. SKY-NET, our aim is to provide highest efficiency mining factory platform and generate highest hash rate with reward any cryptocurrency in today. Our platform, SKY-NET has four body, SKY-Hive, SKY-Hosting/Cloud, SKY-Exchange and SKY-DEX. SKY-NET gives much higher hash rate mining platform than other currently mining solutions and its mining methodologies. To assure consensus on our mining platform, candidates will be able to earn highest hash rate with reward by our hash solution. Sky-Hash has been developing as the Professional Mining Platform for the all of cryptocurrency miners for global miners. This White paper introduces SKY-NET project to people who is interested in Pre ICO sales, ICO and highest hash rate mining. The concept of SKY NET, miners can mine cryptocurrency without having any professional knowledge or experience of setting up and optimizing mining rigs. Sky-Hash may boost up the hash rate up to 30%. We now present our novel business and technology solution. We will also give you details of our platform and its technology infrastructure, our plan, and our token economics.

We hope you enjoy!

2. Introduction Vision

2-1:Background

Risks to Mining: Movement to PoS instead of PoW

Whilst the consensus model most popularly used in mining is currently Proof of Work (PoW), this may change in the future as more projects consider moving to Proof of Stake (PoS). PoW currently requires a very large amount of energy usage due to the processing power required, meaning then that a future with PoS could drastically reduce costs in the mining world. Whilst this may sound like a lucrative opportunity, the rewards from PoS mining are significantly lower. Actors simply keep the transactions fees rather than earning any block reward. PoS requires nodes to already hold a number of coins to rightfully add blocks onto the chain. This needs significantly less power as the computations required are simpler. More coins have specific plans in their roadmap to move to a proof of stake consensus model, with Ethereum looking to join the ranks of other alt coins such as NXT, Decred and Peercoin that already run without PoW. If some technical and logical hurdles can be overcome, we may then see an almost complete move towards PoS. Although due to the conservative nature of bitcoin development it is extremely unlikely that bitcoin itself would ever change its consensus model. PoS mining does bring with it some risks, as there is an incentive for Nodes to validate both chains if there is a fork. This is known as the zero-stake problem, as you do not lose anything from behaving badly in the network due to the low intrinsic costs. The best strategy for a bad actor is to mine on both chains, no matter whether it be accidental, malicious or the true chain. With PoW, miners incentive to put their hashing power on only the correct chain, otherwise they face the chance of incurring high running costs with little to no rewards. PoW continues to be the only real working consensus model for mining at the moment, but we may see a large shift in the next 3–5 years as more protocols are put in place to solve the issues related to PoS. Brian Fabian Crain, host of the Epicenter Podcast and founder of chorus.one, a node validation and staking service for Proof-of-Stake blockchains told Konfid.io: “My view is that Proof-of-Stake has massive advantages in terms of being cheaper, scaling better, being faster, having stronger game theoretic security properties and not being an environmental disaster. The downside is that Proof-of-Stake is more complex than Proof-of-Work, so taking some time, but for the vast majority of applications PoS will make more sense than PoW”

Environmental impact of PoW

Currently bitcoin mining, alone, consumes roughly 0.2% of the world's energy usage and is expected to have the same consumption as Austria by the end of this year. The energy cost of mining can seem excessive due to the large amount of processing power needed to successfully mine blocks onto the chain—but it is worth considering the fact that physical mining for gold is much more resource-intensive than cryptocurrency mining, so the relative impact costs may not be as high as people think. However, with global electricity prices rising and western economies already paying large sums per kilowatt-hour, other methods of energy production will need to be explored. Not only can we decrease the environmental impact that mining has on the world, but we can also look at factors which can significantly lower the financial cost too. One particular way to reduce the cost and environmental impact of mining is by using renewable energies such as wind, solar and geothermal. Cyberian Mine currently makes use of hydro power, allowing for a much lower environmental cost when mining with a PoW consensus method. Mining may be a way of incentive the investment in renewable sources of energy.

The Black Market: With an increasing returns available to miners per coin comes an incentive for people to operate in the black market, where individuals steal energy or break local regulations in order to run mining operations. In April this year 600 computers were seized from a property in Tianjin, China, after the local power grid noticed an abnormal amount of energy being used at the premises. It is currently thought to be the largest energy theft on record in China. The consequences of undertaking an illegal mining operation in China, and many other countries results in the confiscation of illegally operating equipment and the possibility of arrest. Although the country is a key player in the global mining industry due to it's cheap hardware, labor and energy costs, China continues to restrict and discourage crypto mining. A large energy surplus provided a boom to the industry, but with less power being produced in the country now, and a more hostile environment toward cryptocurrencies being, legitimate mining firms are deciding to relocate to more accomodating countries. Illegal mining also occurs in countries with high energy costs, due to the amount of money that can be saved when siphoning power. In South Korea, the most expensive country in the world to mine at a cost of roughly 26,000 dollars/BTC, it is still possible to get attractive rates for agricultural and industrial buildings in underdeveloped areas. This has led to many cases of these premises being illegally rented out to miners, providing them with an unfair advantage in the market. For legitimate facilities, the closure of illegal mining spaces provides more

opportunity for profit. When illegal farms get shut down, the rate of growth on the network slows and provides more room for legitimate miners.

Regulatory Pressure. Governmental bans: Whilst many governments are beginning to regulate the crypto world in an effort to protect consumers and businesses, some are taking punitive measures for different political and economic reasons. China famously continues to clamp down on mining and cryptocurrencies in general, with the People's Bank of China reporting that the Yuan is now only responsible for less than 1% of all worldwide trades in Bitcoin. Vietnam also has its own strict policy, with the government putting in place a total ban on all mining rig imports into the country from August 2018. Tighter regulation is even coming to places like the USA, with some local regions and towns banning mining altogether. Environmental and economic reasons are often behind these bans. The New York town of Plattsburgh put in place "regulations to protect and enhance the City's natural, historic, cultural and electrical resources", after a large number of mining companies flooded the area to take advantage of an available energy surplus. Cyberian Mine and Kintaro have chosen however to operate in countries without large risks to mining operations. Norway, Russia, Switzerland and a few other countries provide numerous benefits for those who wish to mine, with a combination of government support and cheap hardware, labor and energy costs. Mining in crypto-friendly countries, may reduce the chances of illegal mining operations surviving which could lead to the bottom of the black market to fall out. This will leave us with a number of regulated spaces remaining that support the market.

Economic Pressure: The pressure from operating expenses in terms of maintenance, electricity, personnel and facility needs to be outweighed by the revenue generated from mining. These expenses vary from country to country based on the cost of living and economic policies implemented by the respective geographical region. Some regions have even defined policies specially targeted towards mining. Quebec, for example, recently authorized utility Hydro-Quebec to raise the electricity prices to 15 cents per kilowatt hour, about three times the older prices for blockchain price for non-mining use. Although Hydro-Quebec spokesman Jonathan Cote said that they didn't want to send a message to the market, the market certainly reads their action as counter-neutral towards mining. Ultimately, some areas with higher operational costs or unfavourable policies will stop mining and the areas which provide an edge in terms of compliant policies and incentives will prosper further.

Historical Reputation of Cloud Mining: Like the rest of the crypto world, mining has also been a target for a number of scams in the past. Cloud mining scams were particularly

rampant, with lots of people paying for hash power at a mining data center but receiving no rewards in return. Prior to 2014 the costs of mining were relatively inexpensive and rigs could be bought and used at a low price. However, as the price and cost increased it became more difficult for an individual to undertake a mining operation themselves. Scammers saw an opportunity to take advantage of the fact that people needed to group together in order to be able to continue mining efficiently. Vaporware scams have also taken place, with mining offerings that were in no way connected to facilities in the physical world. Interested parties handed over money for machines or hash power that simply don't exist. Investors should then seek to find mining companies where they can physically place and see the hardware, trust those involved and maintain transparency throughout the whole process. Cyberian Mine, in partnership with the team at Konfid.io, offers such an opportunity to investors. Eventually they will move the provenance and the rest of the supply chain for the machines they host onto the blockchain.

Risk of Centralization: The staggering rise in the hash rate recently implies new miners coming into play. Increased Competition in the cryptocurrency Mining space is leading to miner centralization. The pie chart below gives an estimate of hash rate distribution amongst the largest mining pools for bitcoin.

Fig 1: An estimate of the market share of the most popular bitcoin mining pools.

With more mining pools having more hash rate, they have more influence over the network which raises questions regarding centralization and vulnerability of the network. Mining facilities, such as Cyberian Mine, that give access to professional mining conditions without limiting their investors to the major pools may be a way that the spread of decentralization can be prohibited. Clients who choose to colocate their hardware with Cyberian Mine are left with the freedom to select the pool they want to be part of.

The future of mining & distributed data processing: 15 years ago and in line with increasing network bandwidth, businesses other than banks, insurance and IT service providers (who were already there) started to move their company servers into data centers to benefit from higher security, more reliable network connectivity and for multi-office businesses: vastly reduced overheads for managing their servers from a central point. Within 5 years, cloud computing started to emerge with businesses moving their applications and data into a virtualized hardware environment managed by a 3rd party, thus removing their costs and responsibility for maintaining the physical hardware. The benefits being, ease of scale, increased server redundancy and in the case of a multi-national company: having their service closer to the consumer (FOG computing). Within that time, new software defined platforms have emerged to give greater central management to an ever expanding infrastructure spread. Add significantly faster global network speeds and blockchain technologies into the mix and services can now be distributed even further. Although distributed computing is not a new concept, the range of applications to harness this topology has been limited until now where an explosion of distributed and decentralized computing applications are being developed not just for businesses, but also as a means of monetising consumer devices. The popularity for mining will continue to rise as cryptocurrency become more widely accepted and blockchain applications become more useful. Therefore, innovation will continue to evolve mining hardware to be ever more powerful and efficient. The mining innovation will keep be continually improving the profitability and utilization of crypto currency.

The Company's Platform Terminology Used:

The SKYCoin: The SKYCoin will be created on an Ethereum platform following Industry standards. Ethereum Requests for Comments (ERC) is the world's largest protocol for developers across the world ERC are working to improve its efficiencies every day. 232' in ERC232 stands for the unique proposal ID number and is defined by a set of rules which should be met, for a token to be accepted.

There are standard rules which apply to all ERC232 Tokens. These rules are used to facilitate the interaction among the Tokens within its Ethereum network. Technically, these tokens are blockchain assets that have a value. This value can be sent and received to any party with a valid wallet address. Once the platform is operational, we will facilitate the issue of further SKYCoin which will be sold on our platform to third parties. This will enable them to use and access all the services on our platform including the services offered by our partners. RIGToken: The RIGToken is mineable token and it will be used ERC918 which is also same as the Tokens within its Ethereum network. SKY-NET user can exchange SKYCoin to other crypto currency including RIGToken. The rate of exchange will be determined at the value of market. Fig shows the crypto currency market by region. The cryptocurrency market in APAC is expected to hold the largest market during the forecast period. APAC is notable for its high adoption of cryptocurrency. This is attributed to the low cost of electricity in China and early adoption of cryptocurrency in Japan. China is the largest market among all APAC countries.

24H Block Reward	24,000 MONA(\$25,920)		24H Block Reward	1,830 DASH (\$291,696)				

Fig-3: Total major mining stocks per day

Fig-3 shows the total major mining stocks per day. It is about 60 billion dollars or more of currency in a year has been mined and rewarded. Thus, mining market has been developing crypto currency economic field in the world.

Summery: In conclusion we can state that cryptocurrency mining seems ideal for the low risk, lower reward portion of a crypto portfolio. Facilities in locations like Siberia can survive close to 50% of a drop in the value of BTC, and still offer returns to investors above their costs month-on-month. This is a way to mitigate risk in a potentially falling market. However the potential return on bitcoin, or other cryptocurrencies in a market where the value of the coins goes up, would be higher for investing direct in the underlying tokens.

The PoW consensus model may be replaced for projects like Ethereum, but it is here to stay for bitcoin and for some of its potential rivals like the privacy coin Zcash. Mining is projected to be a \$38B market by 2025. Options like crypto loans, regulated funds that give institutional investors access to jurisdictions with the best mining conditions, and efficient management of the rewards earned by mining investors mean mining is still an attractive proposition in 2018.

3. Crypto currency mining methodology in today:

Cryptocurrency mining can be done with multiple ways, i.e CPU, GPU, FPGA and ASICs. The main problem which miners are facing while mining with GPU is setting up the mining rig and optimizing it to achieve the highest hash rate to increase their reward. To start mining, following process are required.

1. Installing the GPU
2. Tuning the GPU
3. Installing the device drivers
4. Adjusting/Setting up the mining software
5. Joining the mining pool
6. Mining

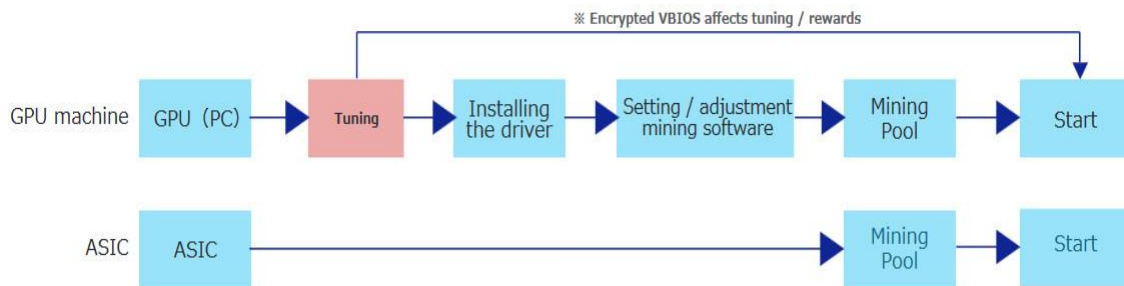

Fig 4: Traditional mining process

The case of AMD GPU, there are so many parameters which are influenced the mining hash rate. These parameter are not constant values. The manufacture maybe select memory chips manufacture or over select clocking on GPU card, or select Open CL Kernel and multiple parameters on mining ware. All of matter is knowhow which miner has to obtain the higher mining hash rate. This setting is not easy for all of mining people. SKY-NET provides the total solution to SKY-NET member even who don't know mining knowhow. We will explain the solution by SKY-NET products as following section.

4. Solution

Product Detail:

SKY-NET Platform:

SKY-NET provides the solution to do easy mining by following four components.

- ① **SKY-Hive**
- ② **Sky-Hosting/SKY-Cloud**
- ③ **SKY-Exchange**
- ④ **SKY-DEX**

SKY-NET provides SKY-Wallet which is hardware based crypto currency wallet. Each member of SKY-NET has own SKY Wallet and store the value of crypto currency which they are holding by themselves.

Member can utilize their coins to own mining, SKY-Hosting, SKY-Cloud and SKY-Exchange. The advantage of SKY-NET member utilize most effectiveness mining hash rate with reward and re investment for mining inside SKY-NET environment. The development for the platform started in 2016. The product has been implemented in Japan GPU mining firm which has 2,300 GPU card in Okayama Prefecture in Japan. Around 50 clients are utilizing these mining facility and more than Millions USD are mined annually. Here we present an illustration of the higher-level process of the Company's platform.

SKY-Hive Function correlation diagram

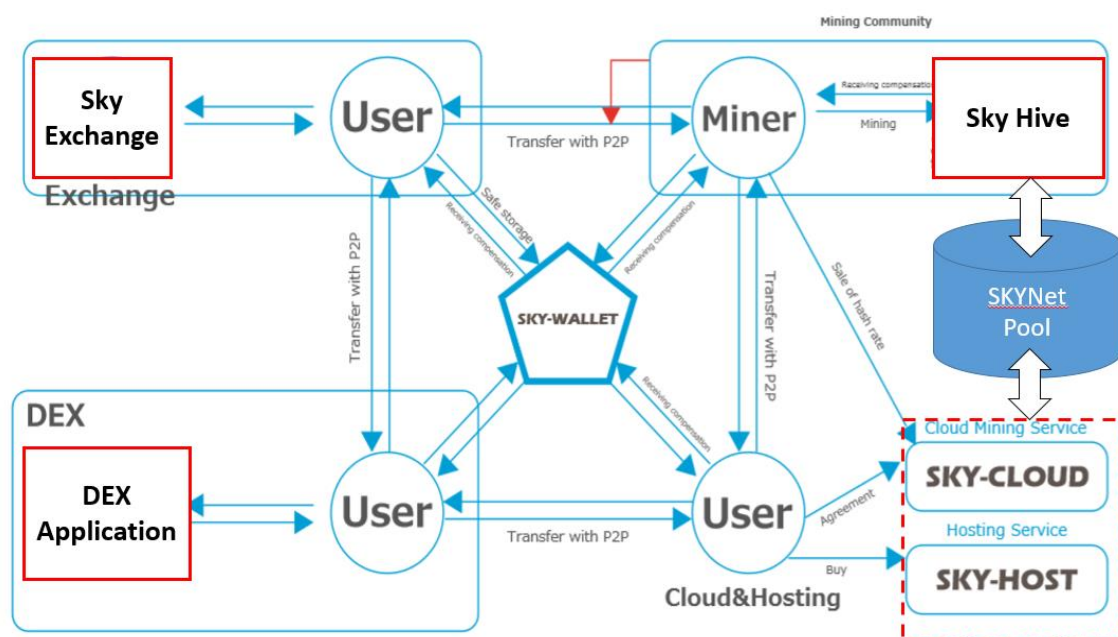

Fig 5: SKY-Hive Function correlation diagram

4-1 SKY-Hive

SKY-Hive is composed multiple features. One is optimized hash rate and others are centralized control and monitoring service as following.

Sky-net design Profession Mining Factory plat home which is called SKY-Hive. Sky-Hive is generated by three main parts.

- 1, Maximized Mining hash rate
- 2, Centralized Rig machine control
3. Environment Monitoring

Maximized Mining hash rate: SKY-Hive provides the Maximized Mining hash rate by multiple technique and its implementation.

SKY-Hive CPU optimizer: SKY-Hive CPU Optimization technique utilizes Instruction level parallel, Thread level Parallels on mining ware and Data Transmission L3 cache layer implementation Kernel drivers. This result was published at IEEE GCCE 2018 international conference in Nara, Japan on 12th OCT 2018 by Prof.Dr.Hiro Takahashi. In the case of SHA256d on i-Core 7 Intel CPU, more than 551% enhanced its hash rate. Other algorithms also evaluated. Now, applied crypto currencies are more than 200 coins. Sky-Hive provides these optimized mining ware to SKY-Net members.

We investigate the source code of Pooler CPU miner to optimize Thread Level Parallelism and modified the code adding on calling sequence for DTS L3 cache layer as Fig 6 and Fig 7. The Original code gets hash block from Crypt currency network and generates multiple processes for available processors. We optimize it to run DTS L3 cache memory space. DTS L3 cache is device driver which is Kernel Program. We modified this device driver for the latest distribution of Ubuntu Linux.

SHA256d TLP optimized on iCore i7-2600 with L3 cache

Fig6 SHA256d hash rate result

Iteration	Default with HDD (khash/s)	code with L3 cache (khash/s)	TLP Optimized with HDD (khash/s)	TLP optimized with L3 cache (khash/s)

5.516 times higher hash rate Than default code

Fig7 SHA256d hash rate comparison

SKY-Hive GPU optimizer: SKY-Hive GPU optimizer provides all of parts of solution for GPU in the market. There are two manufactures, AMD and NVIDIA. Both of case, SKY-Hive supported. We evaluated more than 100 types of coins, SKY Net member can access these optimization codes.

GPU Hive Mining Hash Pro Card (MHPC GPU) and its DTS hash driver is planned:

SHY-Hive makes a plan to design highest hash rate GPU card with DTS driver on 2019. MHPC-GPU card has AMD GPU and L3 DTS cache memory inside board. This GPU card has PCI Express bus as same as other GPU card. Over clocking BIOS, Open CL Kernel turning and Mining ware with DTS layer Kernel driver implemented brings highest hash rate using standard GPU chips.

Sky-Hive also support present GPU card by modified mining ware with DTS driver. It has the potential enhancing its hash rate more than 30% higher than original one.

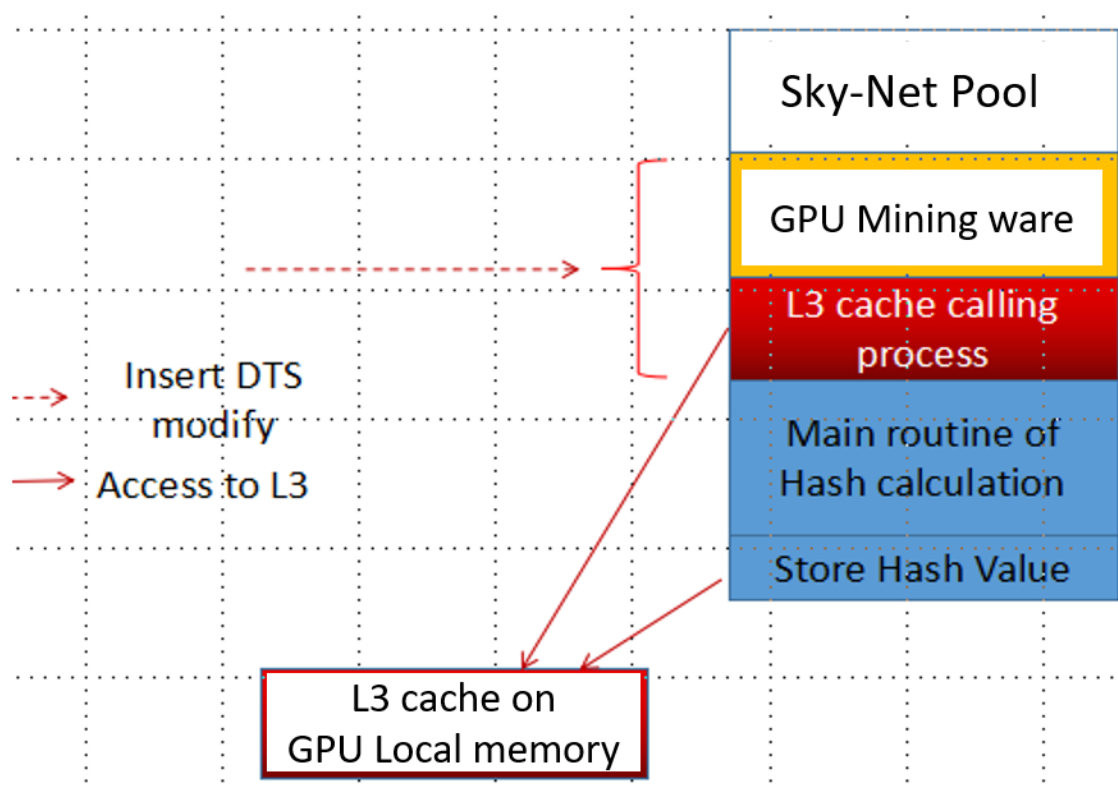

Fig8: L3 cache on CPU mining ware

The instruction execution rate by processor is calculated by the ratio between Clock cycle and Cycle per instruction.

$$ProcessorExecutionRate = \frac{CR(Clockrate)}{\sum_{i=1}^n CPI_{cpu} CPI_{memory} CPI_{I/O}}$$

The gain calculation by cache memory was obtained by Amdahl's Law as following.

$$G_i = \frac{1}{1 - C_i + \frac{C_i}{X_i}} \prod_{j=1}^m L_{i,j} \dots\dots\dots (1)$$

Where

Gi = Gain due to cache at level i

Ci = Cache size ratio (hit rate) at level i

Li,j= overhead factor j, at cache level I,

Xi= Cache speed ratio of lower level storage to higher-level storage media at level i

SKY-Hive ASIC optimizer: Have a plan to provide highest hash rate mining ware for ASICs in the market by the request of mining user in Sky-Net.
SHA 256d based ASICs such as S9 was planned already. Details of support schedule will be released SKY-NET news.

Centralized Rig machine control and Monitoring: Sky-Hive integrates “Orchestration of Optimization Workflow” (O2W), and enables every user to mine with the most efficiency easily. O2W provides the multiple service, including smart UI/UX and the status in detail with the monitoring system and control system that meet the needs for the large-scale operators to the individuals, which will optimize the user's profits stably. O2W does orchestra the all of mining rig machine status, hash rate and its mining program by centralized server.

Fig 9: Centralized Rig machine control and Monitoring

O2W provides the most robust and secure network via VPN against external malicious threats. O2W also function of Artificial Intelligence using Deep Neural Network learns (O2WAI) the behavior of crypto currency rewards and its hash rate. Then recommend the most effectiveness mineable coin at every 12 hours. O2W also provides the function of status monitoring of each Rig machine. The environmental factors such as quo, temperature of GPU, Mother board and/or degrading hash rate by over heat and so on.

Fig 10: One stop solution by SKY-NET.

Fig 11: SKY-NET mining firm

SKY-NET User Dashboards

SKY-NET User Dashboard

SKY-NET user can access SKY-NET User Dashboards on the web site. User are able to register their subscription and categories, as per user preference of mining needs. Once user subscription is active, user can to login and gain access to user dashboard. This dashboard is very easy to use and has a range of management tools. In fact, using these tools would enable SKY-NET user to manage their complete mining model.

Moreover, user can to see an overview of information, from current mining currency to alto coin and updating user's preference and mining plan within six months, gaining access to SKY-NET arbitrage historical big-data.

The SKY-NET User Dashboard recommends the option to update or modify user mining description and most profitable arbitrage coin exchange by SKY-NET DNN (Deep Neural Network) which is arbitrage machine learning unit.

SKY-NET User can also use the search toolbar to find certain mining currency and potential currency may have listed in their profile.

SKY-NET user can organize user entire mining workflow environment, as per as user's mining preference.

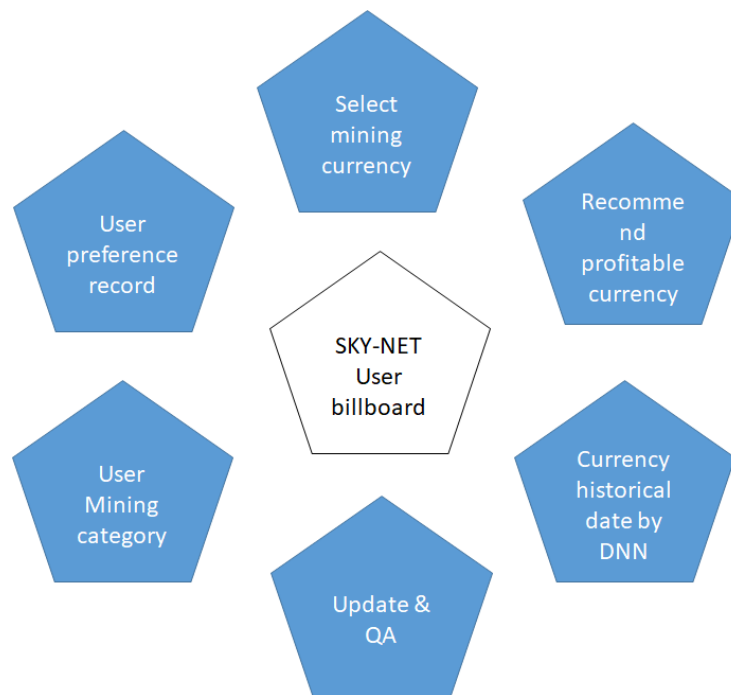

Fig 12: SKY-NET User Dashboard

Both iOS and the Android application would be developed with limited options for each user segment. SKY-NET would also be a section where and when user can buy and sell their SKYCoin.

4-2 SKY-Host / SKY-Cloud

SKY-NET provides SKY Host / SKY-Cloud service. We are preparing lowest electricity facility to maximize your mining profits. The countries which we are arranging, Azerbaijan, Kazakhstan, Uzbekistan and so on, SKY-Host service offers from 6 cents per KW/h.

SKY-Cloud is managed our centralized server for installation of update mining ware, firmware of GPU and observation of its environment including hash rate and temperature.

4-3 SKY-Exchange: SKY-Exchange is the service of SKY-NET User and miner to utilize the maximum effect of cryptocurrency which are obtained by SKY-Hive services. SKY-Exchange connects SKY-Wallet which is holding by users and does following services.

1. Cryptocurrency to cryptocurrency exchange service. (Bitcoin, Ethereum, Monero and SKYCoin)
2. Cryptocurrency to USD exchange service.
3. Cryptocurrency to Debit card service. (SKY-Exchange offers the debit card service from 2019, SKY-Net user can use cryptocurrency for shopping, e commerce and any.)

4-4 SKY-DEX

SKY-DEX is the decentralized application interface. Any decentralized App should connect through this interface. For instance, SKY-NET collaborated with Debit Card servicer. SKY-NET user can utilize debit card service by crypto currency including SKYCoin. Details is shown as following fig 13.

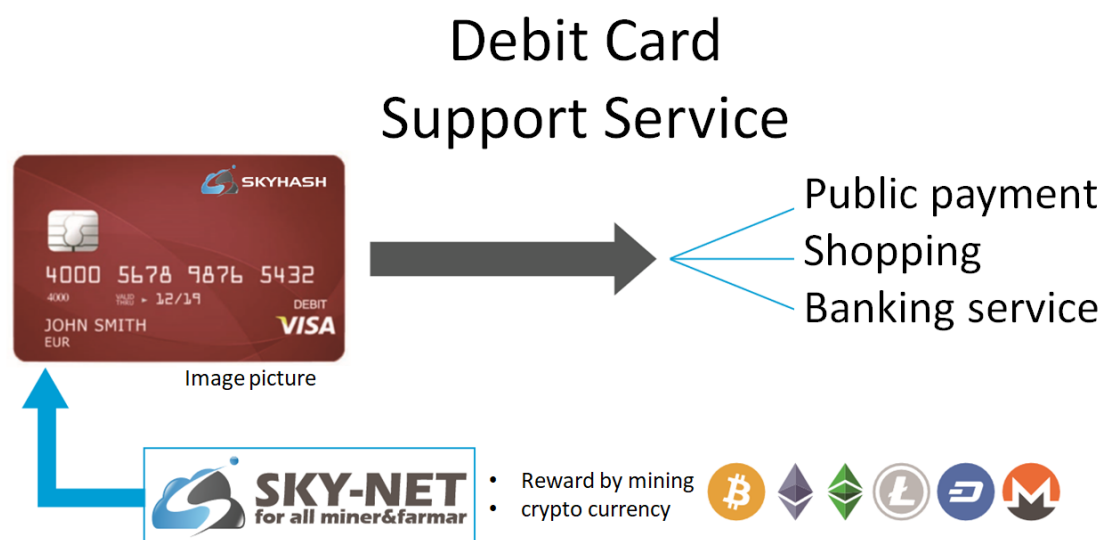

Fig 13: Debit card support service

The partner of SKY-NET provides Debit cards support service for user of SKY-NET using Crypto currency settlement in global market.

Settlement can be done directly worldwide by partnering with crypto currency kept by SKY-NET with external service. SKY-NET users can use BTC and ETH which are mined by applying procedures as they are for settlement.

Thus, SKY-DEX is the service of any decentralized application. All of decentralized application are required the certification process to connect SKY-NET. User can receive any application service from DEX providers with secure policy.

This illustration of SKYCoin distribution.

SKY-NET users are getting crypto currency reward by the cycle of SKY-NET as shown as figure. This reward cycle boost up the amount of volume of any cryptocurrency by SKY-Host, Sky-Cloud even user doesn't have mining rig and its facility. SKY-Hive enable to optimize the highest hash rate at each cryptocurrency. The case of user has already own mining rig, SKY-NET allow to connect SKY-Hive optimized solutions and obtain highest hash rate with reward from them.

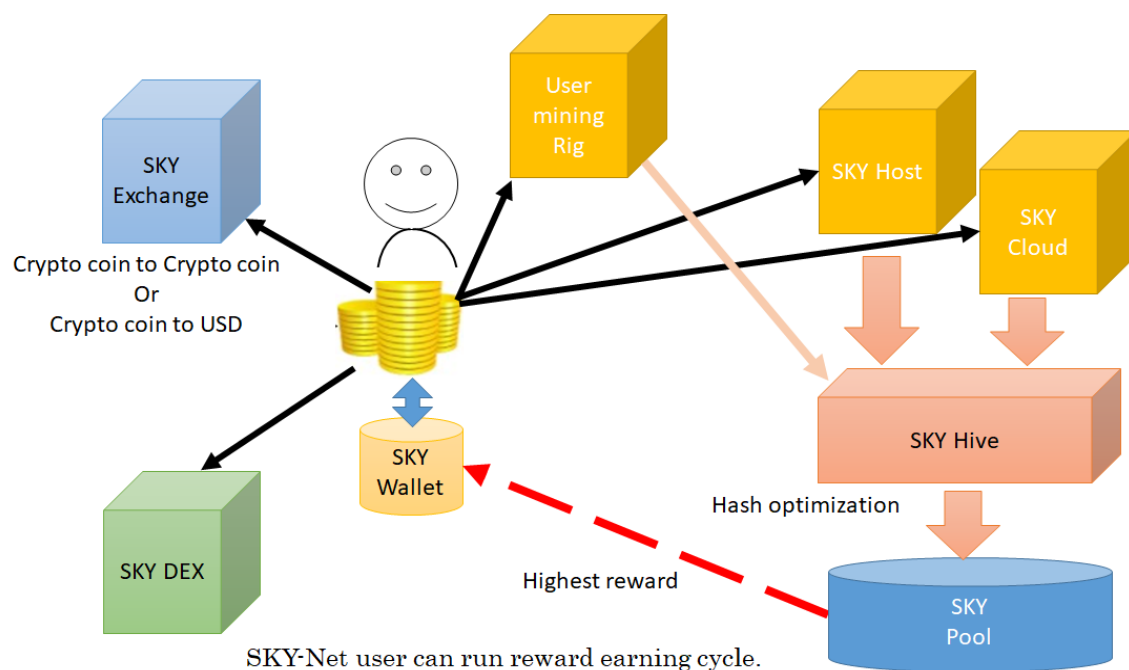

Fig 14: SKYCoin distribution

5.. SKYCoin2, details of Original Blockchain:

The first version of SKYCoin2 which is mineable crypto currency is utilized ERC918. And later we are planning to launch SKY original block chain crypto currency. It will have Proof

of Work consensus algorithm which will use SHA-256 hashing algorithm at 2020. Original Block chain **SKYCoin2** will be generated after merging SKYCoin ERC223 token and ERC918 RigCoin. Below is a sample code of a simple block and blockchain made in Java Language.

This is a simple block

```
import java.util.Arrays;

public class Block {

    private int previousHash;
    private String[] transactions;
    private int blockHash;

    public Block(int previousHash, String[] transactions) {
        super();
        this.previousHash = previousHash;
        this.transactions = transactions;

        Object[] contents={Arrays.hashCode(transactions), previousHash};
        this.blockHash=Arrays.hashCode(contents);
    }

    public int getPreviousHash() {
        return previousHash;
    }

    public void setPreviousHash(int previousHash) {
        this.previousHash = previousHash;
    }

    public String[] getTransactions() {
        return transactions;
    }

    public void setTransactions(String[] transactions) {
        this.transactions = transactions;
    }

    public int getBlockHash() {
        return blockHash;
    }

}
```

Fig 15: Original block chain programming code

There are 2 blocks created in the picture below. The genesis block and the second block

```
import java.util.ArrayList;

public class Main {

    ArrayList<Block> blockChain=new ArrayList<Block>();

    public static void main(String[] args) {
        try{
            String genesisTransaction[]={"Nabeel sent Asif 3 Bitcoins, Kamran sent Nabeel 3 Bitcoins"};
            Block genesisBlock=new Block(0, genesisTransaction);

            String secondBlockTransaction[]={"Nabeel sent 1 Bitcoin to CZone, CZone sent 0.1 Bitcoin to Nabeel"};
            Block secondBlock=new Block(genesisBlock.getBlockHash(), secondBlockTransaction);

            System.out.println("Genesis Block Hash:");
            System.out.println(genesisBlock.getBlockHash());

            System.out.println("\nSecond Block hash");
            System.out.println(secondBlock.getBlockHash());
        }
        catch(Exception e){
            e.printStackTrace();
        }
    }
}
```

Fig 16: genesis block and the second original block chain code

Here is a diagram of mining through SKY-NET platform with following steps.

1. User first register themselves on SKY-NET platform
2. They will then receive the hardware wallet
3. Now user can connect themselves to the sky-hive automated optimization system. The SKY-Hive will be optimized with DTS L3 cache which will increase profitability on mining rigs. Another part of SKY-Hive is automatic optimization of user's mining rigs
4. Sky-Hive is connected to SKY pool. Where users mine together
5. The mined coins are then delivered to each users wallet accordingly

Fig 17: SKY-NET platform steps

This Diagram shows the description of merging of two coins

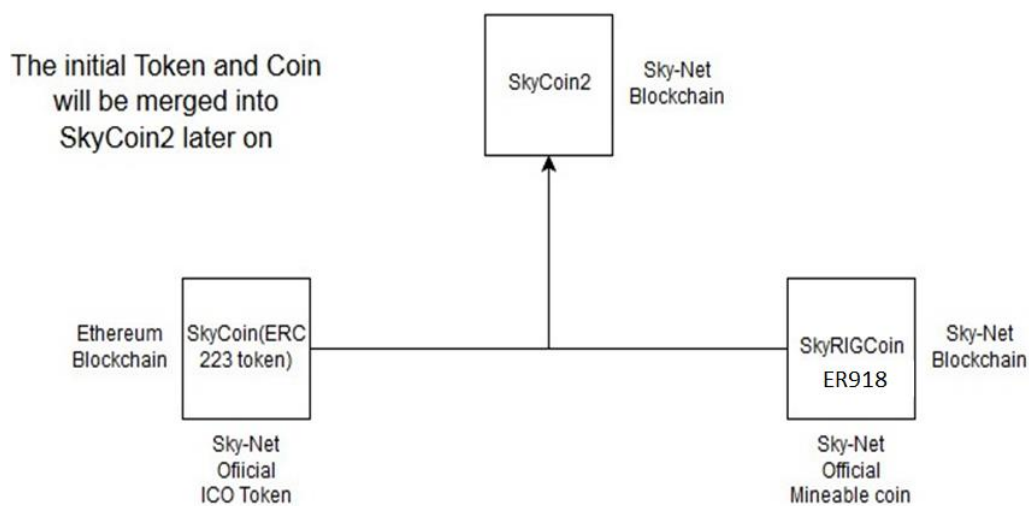

Fig 18: SKYCoin merge process

6. Blockchain, token creation and technical overview.

· Smart Contracts:

The smart contract is a phrase used to describe a computer code that can facilitate the exchange of money, content, property, shares, or anything of value. When running on the blockchain, a smart contract becomes like a self-operating computer program that automatically executes when specific conditions are met. Because smart contracts run on the blockchain, they run exactly as programmed, without any possibility of censorship, downtime, fraud or third-party interference.

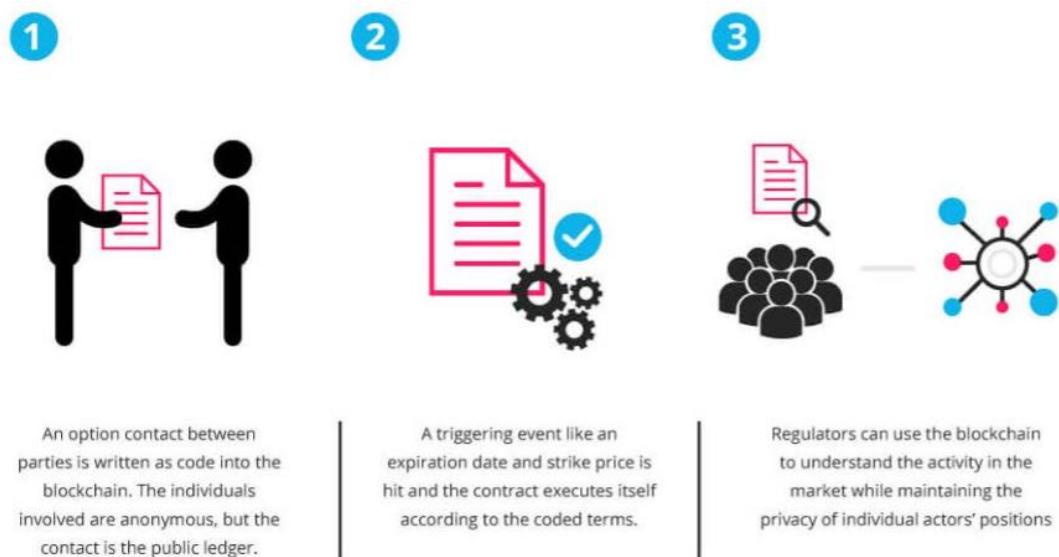

Fig 19: Smart contract

The SKY-DEX application will be built upon an Ethereum consortium type blockchain. The Smart Contract initiates when candidates earn a SKYCoin. Once it's reached at that level, the smart contract will automatically run and create a new transaction into the ledger and assign the respective SKYCoin to the candidate's Block. This becomes all possible by the smart contract because it has the candidate's Ethereum account and public address.

The smart contract is written and stored on the Ethereum blockchain and is used to record transactions and store the block.

The smart contract is initiated by the system automatically, once a transaction of DEX application starts earning their SKYCoin (s) and they will be assigned.

The smart contract initiates not only once, but many times. It just depends when the DEX Application transaction run on SKY-NET.

Consensus Proof-of-Authority

Proof-of-Authority is a newer concept in the blockchain world where you have many preapproved authority nodes (called sealers, think of these as mining nodes). Any new node that you want to add must be voted on by the currently approved set of authority nodes; this gives you full control over which nodes can seal blocks (mine) on your network. To make sure a malicious signer cannot do too much harm to the network any signer can sign at most one of many consecutive blocks ($\text{floor}(\text{SIGNER_COUNT} / 2) + 1$). The same consensus is applied when an authority node is removed from the network.

The Ethereum Proof-of-Authority protocol is called Clique and is well described in the Clique Github. Ethereum Clique proof of authority mechanism, the community can select authority nodes that can authorise transactions. These will be selected by people who contribute most to the community and build out a portfolio of references first. To add a new authority node, all the current authority nodes must agree.

As we are building on the Ethereum consortium network with Proof-of-Authority, the consensus is to be benefited from the lower network costs, latency and solve scalability problems.

Proof-of-Authority provides many advantages for private chains:

It provides more configurability regarding block times and latency, it's not computationally expensive, and it's more secure because of how authority nodes are added.

Regarding the security and safer, SKY-NET is determined to be free from the possibility of hacker attacks, especially as our database consists of personal information and the information regarding token allocation.

Inside the blockchain, the Proof-of-Authority consensus offers more security compared to Proof-Of-State, and more power than Proof-Of-Work. In our view, it is more secure (since an attacker with unwanted connection or hacked authority cannot overwhelm a network potentially reverting all transactions), less computationally intensive (mining with difficulty which provides security requires lots of computation), more performance (Aura consensus provides lower transaction acceptance latency) and more predictable (blocks are issued at steady time intervals.)

7. Introduction of Board Member:

We have an excellent mix of experience and youth among our team who are committed to making the Company an enormous success. Here we present 7 out of 20 members team currently involved in our project.

Founder & CEO : Mr. Shinsaku Imai

Mr. Imai was interested in the block chain from the beginning of 2014, and make and consulting business products. In 2015, he created a cryptographic currency exchange system and Japanese first multiple currency wallet and start using it. Started mining which is the root of the block chain from 2016. Established "SKYHASH OÜ" in February 2018, and operates and holds several mining farms in Asia and Europe and elsewhere.

Chief Mining Engineer: Mr. Yuhi Niimi

Mr. Yuhi Niimi is responsible for the mining business of SKY-HASH from the beginning of 2016 to study and stabilize tuning and stabilization centered on AMD GPU, to set up and operate its own farm. In addition to tuning, familiarize the composition and parts of the entire system, achieve the highest domestic mining efficiency. Sharing know-how as SKY-NET development team. He is responsible for the mining farm operated by SKY-HASH.

Technical Advisor: Prof. Dr. Hiro Takahashi

Prof. Dr. Hiro Takahashi had obtain his doctorate in engineering from the Tokyo Institute of Technology. At the University of Tokyo, as a visiting researcher, he studied high-speed transaction processing from the crowd in the field of human environmental science. His doctoral thesis advocates systematization of low latency autonomous distributed nodes as "multi-layered cache type autonomous decentralized system and its application Web application firewall WAF". In 1990, He has participated in the development of the world's first high-speed shared BUS supercomputer "Radial Super Computer System Bus Architecture" in the US and Japan. He has participated in various projects as a professional in autonomous decentralized system architecture. DTS (Data Transmission System) is his international patent and has experience of commercializing L3 Cache, L4 Cache devices and selling them to the global IT market. In recent years, at the IEEE International Conference GCCE 2018, "We demonstrated the high speed method of SHA 256d hash rate by L3 cache with BitCoin's mining, and announced the conference as a new Block Chain incorporating technology." In this way, the world's most

advanced technology based on the experiences he has created, He will act as a technical advisor to SKY-NET for the creation and verification of basic skills of SKYHASH.

Chief infrastructure engineer: Mr. Daisaku Nishikawa

Mr. Daisaku Nishikawa has experience in operating and maintaining infrastructure at a large server company. He independently worked on management consulting from initial server construction of WEB service such as EC. Mainly in charge of SKY - NET's network construction and reviewing security aspects and operational costs throughout services. He is also mining himself, supporting SKYHASH with a wide range of knowledge.

Chief Application engineer: Mr. Shingo Asano

Mr. Shingo Asano lives in Estonia since 2008. We handle HTML, CSS, Java script, PHP, SQL, Python, Shell Script as front end / back end web developers. He began attendance to Estonia from 2010, succeeded in making various proposals to business customers and forming personal connections around the world. Currently, He support a number of IT companies and support a large number of mining farms in Estonia.

Sales Administrator (CEO Digital Assets Trading) :Mr. Masayuki Fujii

Mr. Masayuki Fujii worked with UK 's "CrypTrade company" in 2015 to do block chain development project. In addition, he established "TradeBitlab" in the country, he is striving to develop killer contents, promoting from the dawn of the block chain, and have a broad network of connections.

He also serves as a representative director of the Japan Mining Association.

Sales Administrator (CEO GLOBAL INTELLISENSE, inc.) :Mr. Katsutoshi Madono

Mr. Katsutoshi Madono is No. 1 market capitalization ranking in the VALU (VAL +You). He provides the service of management consultant including major companies. He is also a WEB producer, and each time the project has over 100 million experiences and students exceed 1,000. Switzerland · Overseas Trade · Overseas Real Estate Division also has dealt with overseas governments and chaebols and investment deals. Currently, as a management consultant, taking advantage of sales operations learned through store management and the latest WEB marketing skills, he engaged in support of small businesses and individuals, including large companies.

8. Road Map

The development of the Company's platform started from 2017. More than 2 Million dollars has been invested in developing and carrying out the proof of concept.

In this section, the road map was illustrated our future releases and expansions, with detailed explanation in text.

ICO Timeline

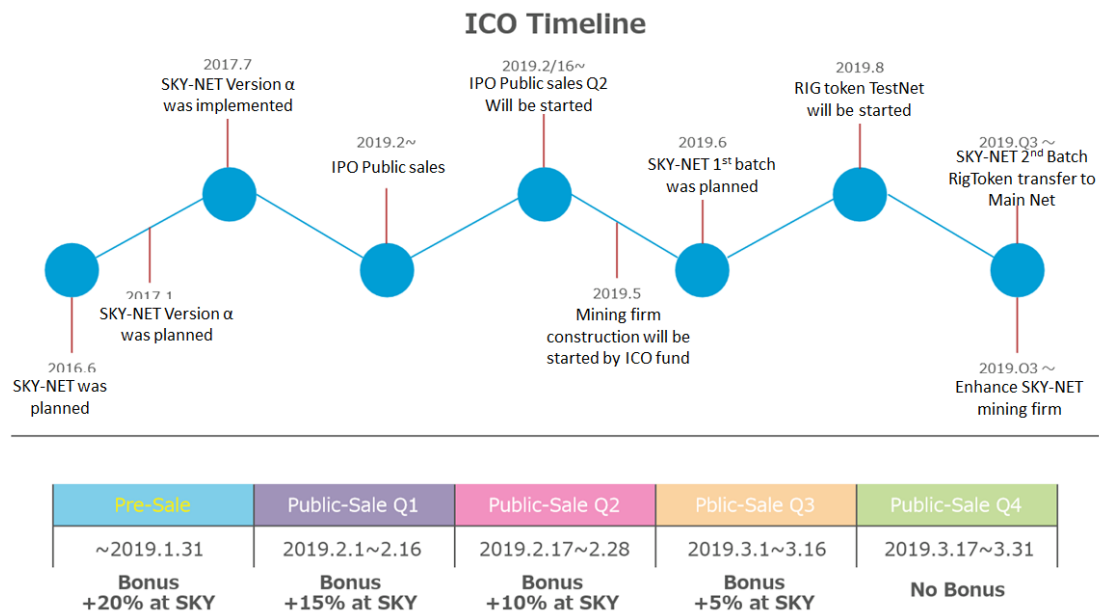

Fig 20 ICO time line

Pre Sales of ICO: Until 31st JAN 2019

The pace and scope of ICO Pre-Sales OPEN from 2018 and it has been open until 31st JAN.

Public Sales of ICO start from 1st of Feb 2019

The pace and scope of ICO Public Sales OPEN, and Q2 of ICO sales start from 17th of FEB. The schedule of Public Sales of ICO is planned as Q3 from 1st of MAR and Q4 from 17th of MAR.

The Bonus coin for each Quarter is following.

Pre-Sale +20%

Public-Sale Q1 +15%

Q2 +10%

Q3 +5%

Q4 No Bonus

At May 2019, ICO funds starting mining firm and related facility at lowest electricity countries. At June 2019, SKY-NET 1st batch was planned and Aug 2019, RIG token ERC918 based TestNet will be started. From Q3 2019, SKY-NET 2nd Batch RigToken transfer to Main Net and Enhance SKY-NET mining firm

Product & Service Expansion:

Android OS, iOS App are supported by SKY-NET products line including AI arbitrage recommendation on user billboard. GPU hash rate optimization mining ware will enhance user mining hash power on current GPU card at beginning stage. Low cost electricity will offer to user to reduce the total mining expenses.

Programming and Advanced Technology Expansion

The SKY-NET billboard web site has been developing using PHP and central Rig management server is running on Linux infrastructure on mining firm. Blockchain and other complex functionalities are made using Java and Python. We plan to launch mining GPU hardware using DTS layer kernel driver to maximized GPU hash rate, later.

Bring on partners:

We will creates the collaboration with crypto currency exchanger, debit card, credit financial bank in the world.

We also plan to establish the blockchain mining enhancement development center for SKY-NET user. aim to plan and scale-up our underline of mining research and development engineers, it can support the load resulting from our reward effectiveness system growth. We also aim to evaluate the total amount in growth of SKY-NET users reward income and ROI by mining investment.

Expand the regional support center in the US, Canada, EU, GCC and all of ASIA by 2022.

9. Token Economics

This section describes various aspects of our Talent Coin Network, the SKYCoinale, and the economics of both.

Considerable thought and a huge amount of time has been spent on finalizing the economics of our Talent Coin, which provides long-term stability and growth. The vision is to attract long-term investors through our coin sale.

SKYCoin Allocation

SKYCoin will be distributed to 6 major participating groups in the SKYCoin Network. This allocation would be written into the blockchain block itself, which would be operated through three recognized signatories.

Each

Distribution Ratio For ICO

Fig 21: Distribution Ratio For ICO

Fig 21 shows Distribution Ratio For ICO. Each group is critical to our recruitment ecosystem's creation, development, growth, and maintenance:

- 15% of the SKYCoin will be distributed to the candidates and investor for Pre-sales. - For providing correct information on our platform, providing details of the referees, taking a technical evaluation on the platform and much more, etc.
- 72% of the SKYCoin will be distributed to the people for Public Sale. - For any investor or business organization and its entities.

- 5% of the SKYCoin will be distributed to Founder (Blockchain based allocation,) - For funding the platform development, business development, partnerships, support, and more.
- 3% of the SKYCoin will be distributed to Technical team members (Blockchain based allocation, Mining Optimization and management) - For funding the platform development and more.
- 2% of the SKYCoin will be distributed to Adviser (business and technical advisory task, market development and more.
- 2% of the SKYCoin will be distributed to Seed Investor who invest at early stage of SKY-HASH company.

SKYCoin also needs for fundraising. The Company requires significant funding to develop, launch, and grow the Company's network. We must develop all the software required (this includes: the SKY-NET wallet, SYK-Hive, SKY-Exchange, SKY-DEX and billboard web site and multiple Decentralized Apps.

ICO Funds Breakout

Fig 22: ICO funds breakout

The offering of SAFTs:

40% of usage of fund will be utilized by SKY-NET development.

40% of usage of fund will be utilized by Building of Mining firm.

10% of usage of fund will be utilized by Operation of company.

5% of usage of fund will be utilized by Advertisement and promotion.

5% of usage of fund will be utilized by legal operation

10. Details on issuing tokens:

SKYCoin :

SKYCoin (SKY) is the utility token SKY-HASH issues for ICO, which is used for the reward token, and will be used for the incentive, reward promotion by Staking, and such within the SKY-NET ecosystem. SKYCoin will be issued up to about 60 million pieces and the fifty percent from total issues of SKYCoin (30 million pieces) is assigned by ICO. SKYCoin holders can gain the RIG right to mine at the mining farm built by a part of funds raised, and also gain pre-mined RIG.

+++++

Specification of SKYCoin (SKY)

The number of issues of coin=60,000,000 pieces

The number of issues of ICO=30,000,000 pieces

Selling price per coin = 1 Euro

Purchase currency = ETH

Published type of coin = ERC223 or ERC777

Soft cap = 20,000 ETH

Hard cap = 300,000 ETH

+++++

SKYRIGCoin(SKY2):

SKYRISCoin (SKY2) is mineable coin which is utilized original block chain. SKYCoin owner can participate pre mining term which is the first six month before public the SKY2 mining operation.

+++++

Specification of **SKYRIGCoin(SKY2)**

Publication of method of mining (PoW)

Published type of coin = ERC918 and later move to SKY Original Block chain

Start of mining at Q3 2019

General mining open from Q4 2019

+++++

SKY-NET provides two types of coins. The advantage of SKYCoin owner obtain the chance of pre mining for SKY2 Rig coin. The exchange rate of both of coin will be

announced by SKY-NET exchanger billboard.

Eventually, two coins will be merged to SKY2Coin at 2021 was planned.

The Company's team is conducting an offering of SAFTs (see the legal section of this document) through our partner exchange. We have already started reaching out to relevant exchanges. Will notify all the stakeholders once we finalize on the exchange
This offering is happening in three parts:

(1) A sale for early believers = 1,000,000 USD:

We understand the risk that early believers would be taking to participate in this sale. However, the initial phase of this sale would be rewarding for all participating investors & early believers. This sale would run at a flat discount rate of 70% with no vesting schedule. Discounts for the rest of all the phases of the SKYCoin sales would be less and tied to a vesting schedule.

(2) A Pre-ICO sale for institutional investors with the Hard cap = $(30\% / (30\% + 57\%))$ from 300,000 ETH:

Most of the proceeds from the earlier round would be invested into our sales and marketing for our ICO. Our aim is to specific targeting institutional purchasers. The amount targeted, will assure us that the project deliverables could be completed on time and that we have enough resources to support it.

(3) ICO Sale to the public with Hard cap = $(57\% / (30\% + 57\%))$ from 300,000 ETH:

This phase would be targeted to smaller purchasers and the public. Recruitment communities across the globe would be our primary target for this segment. This phase of the sale is important for two reasons. Firstly, any funds raised would speed up the development and expansion of the Company's ecosystem which would ensure that we stay well ahead of our competition. Secondly, it would enable us to reach out to the recruitment community to create a market buzz about our ecosystem. Broad Token Sale approach:

We hope to bring together a large and diverse group of purchasers from around the world, who would want to work closely with us to build our powerful recruitment platform. We are primarily seeking strategic investors who have something of high-value and unique to offer. We also wish to reach a broad range of investors. We will be currently seeking out people from diverse backgrounds and skill sets. We want investors who can add value, share their skills, their knowledge, and their networks to achieve our success.

We have structured our token sale to reward a large group of people who can help us to build our network. We aim to achieve this through selling our SKYCoin for, in our opinion, a much lower price than its worth.

11. RISK FACTORS

THIS SECTION ON RISK FACTORS IS NOT AND DOES NOT PURPORT TO BE A COMPLETE ENUMERATION OR EXPLANATION OF THE RISKS INVOLVED WITH THE PURCHASE OF SKYCOIN. THERE MAY BE ADDITIONAL MATERIAL RISKS THAT THE DIRECTORS DO NOT CURRENTLY CONSIDER TO BE MATERIAL OR OF WHICH THE DIRECTORS ARE NOT AWARE. THE FOLLOWING THEREFORE HIGHLIGHTS CERTAIN RISKS TO WHICH THE COMPANY IS SUBJECT TO AND WHICH THE COMPANY WISHES TO ENCOURAGE PURCHASER TO DISCUSS WITH THEIR OWN PROFESSIONAL ADVISORS.

Prospective SKYCoin purchasers should conduct such independent investigation and analysis regarding this Company, the SKYCoin and all other relevant market and economic factors as they deem appropriate to fully evaluate the merits and risk of their purchase.

The Company and its Directors disclaim any responsibility to advise purchasers of SKYCoin of the risk and considerations associated with the purchase of SKYCoin as they exist at the date hereof or from time to time hereinafter.

Each prospective purchaser of any SKYCoin must determine, based on his/her own independent review and such professional advice (including, without limitation, tax, accounting, credit, legal and regulatory advice) as it deems appropriate, that the purchase of SKYCoin is appropriate and suitable for it, notwithstanding the clear and substantial risks inherent with the purchase of SKYCoin.

You should consult with your own legal, regulatory, tax, business, investment, financial and accounting professional advisors to the extent that you deem it necessary, and make your own decisions including decisions regarding the suitability of this purchase based upon your own judge and upon advice from such professional advisors as you deem necessary and not upon any view expressed men by any party mentioned in this Whitepaper.

The purchaser of a SKYCoin should be capable of evaluating the merits and risks of such a purchase and should have sufficient resources to be able to bear any losses (which may be equal to the whole purchased amount) that may result from such a purchase. Prospective purchasers of SKYCoin should be aware that the value of SKYCoin may go down as well as up and that they may not be able to realize their purchase amount on the secondary market (if there is any). Forward looking statements

Certain statements in this whitepaper constitute “forward looking statements” that are used on the beliefs of the Directors and reflect their current expectations. When used in

this whitepaper or in any of the Company's material, the words "estimate", "project", "believe", "anticipate", "intend", "expect", "plan", "predict", "may", "should", "would", "will", the negative of these words or such other variations thereon or comparable terminology are intended to identify forward-looking statements. Such statements reflect the views of the Directors at the time the statements are made with respect to future events based on information available at that time, and are subject to risks and uncertainties that could cause actual results to differ materially from those contemplated in those forward-looking statements. The Directors assume no obligation to update or revise these statements to reflect current information, events, or circumstances, including changes in any risks or uncertainties that may impact them.

Management Risk

If any of the directors or officers of the Company cease to participate in the operation of the Company, the operations, objectives and activities of the Company may be adversely affected.

Liquidity of SKYCoin

As at the date of this whitepaper, there is no active secondary market for the SKYCoin. Whilst the Directors hope that the success of the Company will lead to a secondary market developing, there is no guarantee or assurance that a public market will ever develop. There is often no assurance that a purchaser of the SKYCoin will be able to sell or dispose of the SKYCoin.

Changes in Applicable Law and Regulation

The Directors believe that it is possible that emergency intervention by certain Governments may take place in the future in respect of ICOs. Such intervention may be implemented on an "emergency" basis, subjecting market participants without notice to a set of regulations which in some cases may be unclear in scope and in application.

Should any relevant laws or regulations change, the legal requirements to which the Company and the SKYCoin may be subject could differ materially from current requirements. No assurance can be given that future legislation, administrative rulings or court decisions will not adversely affect the Company and the SKYCoin.

The Company may be subject to a number of unusual risks, including contradictory legislation, incomplete, unclear and changing laws, ignorance or breaches of regulations on the part of other market participants, lack of established or effective avenues for legal redress, lack of standard practices and confidentiality customs characteristic of developed markets and lack of enforcement of existing regulations.

Early Stage Companies

The Company is a start-up and has no operating history against which purchasers of the SKYCoin may consider the appropriateness of purchasing the SKYCoin.

Many risks and uncertainties affect start-up and early stage companies, which often have very limited operating history, profits or cash flow. There can be no assurance of the success of such enterprises. Their potential must be considered in light of the problems, expenses, difficulties, complications and delays frequently encountered in connection with new or developing businesses, including technology risks, unproven business models, untested plans, uncertain market acceptance, competition and lack of revenues and financing.

The technological fields and markets that many start-up and early stage companies address have undergone and are expected to continue to undergo rapid and significant change. Rapid technological developments may result in the technology of companies becoming obsolete, uneconomical or uncompetitive before any commercial success or financial return can be achieved. Numerous other risks may affect developing companies and ventures, including risks that products or services will be found to be ineffective, unreliable, unsafe or uncompetitive and risks that such companies' technologies, products or service will not achieve market acceptance or penetration. Market acceptance of new products, services or technologies depends on many factors and uncertainties and cannot be assured.

Start-up and early stage companies may compete with entities that have established businesses, relationships and positions in the market and that have much more substantial financial, business, technological, marketing and distribution assets, operations and resources. There can be no assurance that any developing company will be able to compete successfully with more established companies.

These companies may be overly dependent on the vision, skill and leadership of a single or limited number of executives. In a start-up business, the loss or disability of a key person(s) can result in significant financial hardship, in some cases the failure of the company. More than other businesses, start-ups are highly dependent on the skills and contributions of very few key employees

Any projections, forecasts, plans or other forward-looking statements are subject to numerous risks, uncertainties, changing circumstances and other factors that could cause actual results, performance, plans, prospects, operations and opportunities to differ materially from any forward-looking statements, including competition, inability to identify and do business with appropriate customers, existing and future law and regulations, liabilities under the securities laws, inability to hire, retain or qualify sufficient management and staff, general economic conditions, rapid technological change, cost overruns, delays in bringing products or services to market, marketing failures, difficulty in penetrating markets, delays or failures in developing anticipated

capabilities, products or services, failure to obtain necessary regulatory approvals, insufficient funding, lack of availability of capital, rates of economic growth, levels of consumer and business spending, conditions in the technology and financial industries, dependence on strategic partners and business relationships, unproven business models, adverse developments affecting customers and end-users, fluctuations in securities markets and valuations, limited marketing, expansion risks, losses and costs, uncertain revenues and profitability, conditions in particular industries, accounting problems, costs, delays and liabilities arising from legal proceedings, failure to obtain and maintain intellectual property or proprietary rights and management failures.

Estonia

Estonia is part of the EU, having joined the European Economic Community. The law of Estonia, According to the Constitution of Estonia (Estonian: Põhiseadus) the supreme power of the state is vested in the people. The people exercise their supreme power of the state on the elections of the Riigikogu through citizens who have the right to vote. The supreme judicial power is vested in the Supreme Court or Riigikohus, with nineteen justices. The Chief Justice is appointed by the parliament for nine years on nomination by the president. The official Head of State is the President of Estonia, who gives assent to the laws passed by Riigikogu, also having the right of sending them back and proposing new laws.

The President, however, does not use these rights very often, having a largely ceremonial role.

The Company's cash will be held by a bank. The Company acknowledges that any such deposits are not guaranteed by the bank and are exposed to losses incurred in the event of the insolvency or failure of the bank. The Company will take credit risk against any party which is holding its cash. The Company will therefore rank as a general unsecured creditor in the event of the insolvency or failure of the bank with which deposits or instruments have been placed. Regulatory Supervision

The Company and the SKYCoin are not regulated by the Estonia Financial Services Commission or any other regulatory or supervisory authority. The Estonia Financial Services Commission does not vouch for the financial soundness of the Company, the SKYCoin or for the correctness of any statements made, or opinions expressed with regards to it. Cybersecurity

Cybersecurity threats are present within the realms of cryptocurrencies. There is a risk of loss of funds, including a total loss, should an unauthorized intrusion or theft occur.

Whilst the Company has considered its cyber security, risks related to software weakness, human error, external attacks and others, continue to exist and pose a material risk to the Company and the value of the SKYCoin.

Advances in cryptography, or technical advances such as the development of quantum computers, may present risks for crypto-currencies and the SKY-NET platform, which could result in the theft or loss of SKY-NET hash rate.

Hackers or other malicious or criminal groups or organizations may attempt to interfere with the Token Sale, the SKY-NET network or the availability of SKY-NET hash rate in several ways including, but not limited to, denial of service attacks, Sybil attacks, mystification, phishing, attacks, smurfing, malware attacks, or consensus-based attacks.

Ethereum Network

The SKYCoin is a part of the Ethereum network. If problems related to the Ethereum network normal functionality arise, this may affect the SKYCoin functionality and may adversely affect the Company and the value of the SKYCoin. Therefore, any malfunction, unplanned function or unexpected operation of the Ethereum protocol may cause the SKY-NET network or SKY-NET hash rate to malfunction or operate in a way that is not expected. Ether, the native Ethereum Protocol account unit may itself lose value in a similar way to SKY-NET hash rate, and also in other ways. For more information on the Ethereum protocol, see <http://www.ethereum.org>

As with other decentralized cryptographic tokens and crypto-currencies, the Ethereum blockchain used for the SKY-NET network is vulnerable to mining attacks, including but not limited to, dual-expense attacks, powerful mining attacks, selfish mining attacks, and critical competition attacks. Any successful attack poses a risk to the SKYNET software and the expected performance and sequencing of Ethereum contract calculations. Despite the best efforts of the SKY-NET team, the risk of known or new mining attacks exists.

Crypto-currencies and cryptographic tokens are a cutting-edge, untested technology. In addition to the risks stipulated above, there are other risks that the Connect Job team cannot predict. Risks may also occur as unanticipated combinations or as changes in the risks stipulated herein.
